## Abstract

This is the abstract.

## Introduction

This package was created as part of the training course “Good practices for reproducible research in digital ecology” co-organized by the Cesab of the FRB and the GDR EcoStat. It uses the model de Bertalanffy (1938).

## Material and methods

*Datasource.* The data used comes from the website <https://www.fishbase.in/home.htm>.

*Statistical methods.* The Growth model of Von Bertalanffy is

$$Linf.(1 - \exp^{-K*(a-t_0)})$$

with Linf = maximum size, a = fish age, K and t0 are fixed parameters.

Model was adjusted using the method described by Rafail (1973).

## Results

The results of the model are presented in Figure 1.

## Discussion

Working with others on a project is much more complicated than working alone, but much faster.
