 $^a Department, \ Street, \ City, \ State, \ Zip$ 

#### Abstract

This is the abstract.

#### Introduction

This package was created as part of the training course "Good practices for reproducible research in digital ecology" co-organized by the Cesab of the FRB and the GDR EcoStat. It uses the model de Bertalanffy (1938).

#### Material and methods

Datasource. The data used comes from the website https://www.fishbase.in/home.htm.

Statistical methods. The Growth model of Von Bertalanffy is

$$Linf.(1 - exp^{-K*(a-to)})$$

with Linf = maximum size, a = fish age, K and t0 are fixed parameters. Model was adjusted using the method described by Rafail (1973).

#### Results

The results of the model are presented in Figure 1.

### Discussion

Working with others on a project is much more complicated than working alone, but much faster.
